Continuation of 3. NOTE: The applicant amends claim 1 to incorporate claim 2, which changes the scope of cliams 5 - 19. The applicant also adds claims 20 - 22. Regarding the applicants arguments with respect to claim 1, the examiner respectfully disagrees with the applicant. 1. The applicant argues that the barrier layer is not doped, however one may consider an AlGaN layer to be an GaN layer doped with Al. The process by which a product is made is not germane to the device claim. 2. The applicant argues the well layer does not have a thickness within the range of 0 - 1.5 nm, however the office action explicitly shows the art of Yamada may have portions of the barrier layer less than 1.5nm, and therefore within the range of 0 - 1.5 nm. 3. The applicant argues that the art of Yamada does not disclose the Ohmic electrode has an aperture through which a portion of the contact layer is exposed. A common definition of "aperture" is a "device that controls amount of light emitted". Layer 112 may be considered to comprise an aperture since Yamada discloses it to be transparent (col. 10, lines 42 - 43) and containing Ni and Au, which can control the admission of light into the layer. The underlying contact layer 111 is exposed on the sides of layer 112 and exposed to the light through layer 112 since the layer is considered to be transparent.
